CalmLane

A study space that listens first.

CalmLane is a mood-adaptive focus and wellness app for students. Tell it how you feel, and the whole interface reshapes around the answer, with no streaks, no badges and no guilt. Built for the **Hyperbloom October** UI/UX & Web Design hackathon.

The problem

Many productivity apps rely on red badges, streak shaming and dense dashboards. On a hard day, that adds pressure when you need less of it. For students dealing with exam stress, ADHD, dyslexia or anxiety, this is often why they stop using such apps.

The idea: the Shapeshifter

Pick a mood (Energised, Focused, Okay, Anxious, Drained) and the UI adapts: colour palette, motion, density, greeting copy, task suggestions and the recommended tool.

- **Drained:** one tiny task and a 60-second breather, everything else hidden.
- **Anxious:** breathing and brain dump first, cooler palette.
- **Energised:** hardest task first, 45-minute deep session.

Features

- Mood-adaptive dashboard with a "Why this?" explanation
- Focus room: 15/25/45-minute timer, animated SVG ring, soft Web Audio chime, "Gentle exit" button
- Brain dump: sorts messy thoughts into Quick wins, Medium and Deep work
- Guided breathing: 4-7-8 and box breathing
- Insights: hand-drawn SVG charts that update as you finish sessions ("days you showed up", never missed days)
- Accessibility panel: dyslexia-friendly mode, text size, high contrast, reduced motion, light/dark/auto theme, Calm mode (one task only)
- Interactive Canvas orb on the landing page that reacts to the cursor and mood

Accessibility

- Semantic landmarks, skip link, correct heading order
- Visible 3px focus rings and full keyboard support
- aria-live regions for the timer and breathing cues
- Respects prefers-reduced-motion and prefers-color-scheme
- 44px minimum touch targets
- Colour is never the only signal (icons plus labels)
- Contrast designed to meet WCAG AA across moods and themes

Tech

[Edit to match your final version] HTML, CSS and vanilla JavaScript in a single file. Canvas 2D for the orb, hand-built SVG for charts, Web Audio API for the chime, localStorage for saved preferences. No backend. Fonts: Fraunces and Atkinson Hyperlegible (Google Fonts).

AI tools were used to help build parts of this project: [list the tools you used]. Design direction, flows, testing and fixes were done by me.

Run locally

Open `index.html` in any modern browser. No build step needed.

Honest notes

- The case study is a **design hypothesis**, not the result of a formal user study.
- Data is stored only in your browser (localStorage).

What's next

User testing with students (including neurodivergent students), a command palette (Ctrl/Cmd+K), per-mood soundscapes, persona presets and a shareable weekly summary.
